Facility Data Quality — Supervision Overview, Uasin Gishu County

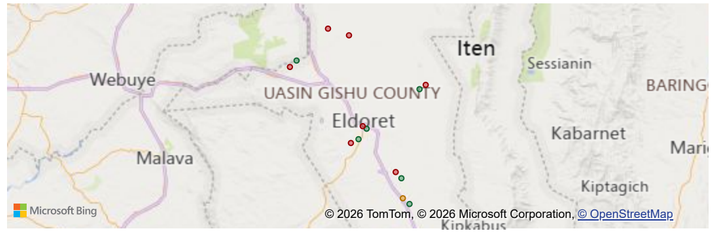

Which sub-counties show the biggest gap between reporting timeliness and actual data quality?

Total Visits
41

Avg Quality Score
3.27

Total Discrepancies
282

Facility Locations by Data Quality Band

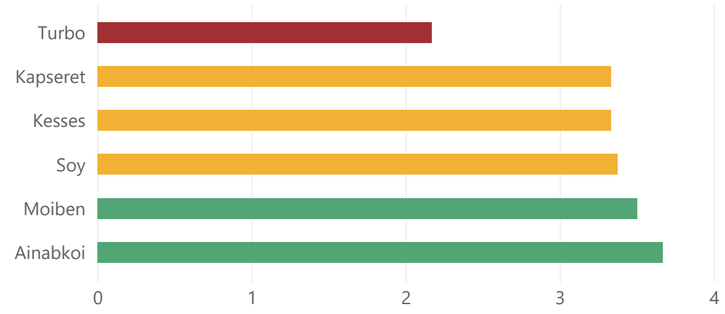

Fair (3) Good (4-5) Poor (1-2)

- [ ] Moiben
- [ ] Soy
- [ ] Turbo

Data Quality Score by Sub-county

Avg Data Quality Score Over Time

Key Insights

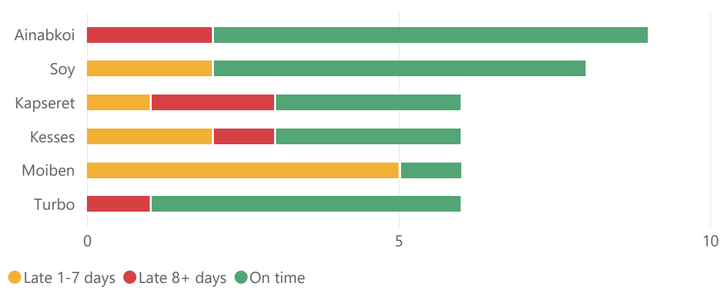

1. Turbo has the lowest quality score (2.17), yet only 1 of its 6 visits was late.

2. Quality score and discrepancy count move inversely (r = -0.47, p = 0.002, n = 41).

3. Moiben has the most late reports (5 of 6) but a strong score (3.50).

4. Ziwa and Huruma each logged 43 discrepancies, driving their sub-counties' totals.

Reporting Timeliness by Sub-county

Visit-Level Detail

Facility	Sub-County	Visit date	Quality band	discrepancy severity
Kesses Sub-County Hospital	Kesses	26/08/2026	Poor (1-2)	Medium
Moiben Sub-County Hospital	Moiben	26/08/2026	Poor (1-2)	Low
Calcare Hospital	Ainabkoi	24/08/2026	Fair (3)	Low
Kamara Hospital	Kesses	18/08/2026	Good (4-5)	Low
Palmcare Sinal Hospital	Moiben	17/08/2026	Good (4-5)	Low
Turbo Sub-County Hospital	Turbo	14/08/2026	Good (4-5)	
Langas Sub-County Hospital	Kapseret	12/08/2026	Good (4-5)	Medium

Recommendations

1. Prioritize a follow-up supervision visit to Turbo — its low quality score is not explained by late reporting and warrants closer review of underlying causes.

2. Investigate the Ziwa and Huruma outlier visits specifically to determine whether they reflect one-off incidents or a recurring facility-level issue.

3. Since timeliness and quality don't always move together (see Moiben), continue tracking both metrics separately rather than relying on submission timeliness as a proxy for data quality.

Routine Reporting Trend — ANC 1st Visit (DHIS2)

This panel pulls live routine indicator data via the DHIS2 API, demonstrating integration with a health information system alongside the KoboToolbox supervision data on Page 1. Because this uses DHIS2's public demo instance, the two data sources reflect different organizational hierarchies and are presented as parallel panels rather than row-level merged. In a production deployment, this same pipeline would connect to the facility hierarchy referenced in the supervision checklist.

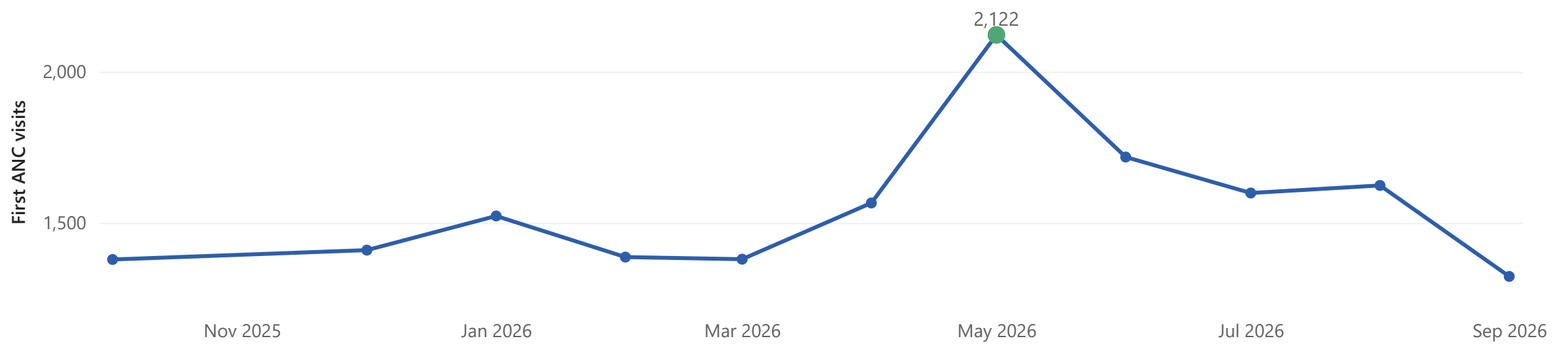

Average across 11 reporting months.

ANC 1st Visit — Monthly Trend

Peak: 2,122 visits in May 2026

Key Insights

1. ANC 1st visits averaged about 1,548 per month across the 11 months with data, ranging from 1,323 (Sep 2025) to 2,122 (May 2026).

2. May 2026 is a clear spike, about 37% above the average. The following three months settled around 1,600-1,700, still above the roughly 1,300-1,400 seen in late 2025.

3. No value was reported for November 2025, so the average and trend use the 11 months that have data.

Note: this is DHIS2 demo-instance data, so the patterns illustrate the pipeline rather than real service delivery.

Recommendations

1. Verify the May 2026 spike against source registers before treating it as a real change in uptake. A spike this size can reflect an outreach campaign, but also duplicate entry or a reporting error.

2. Follow up on the missing November 2025 report and track reporting completeness as a standing indicator.

3. In production, connect this indicator to the same facility hierarchy as the supervision checklist, so facilities with low data quality scores can be checked against their reported ANC trends.
